day hold period. Although the undereigned felt that handdity would have

missile and resove the unit during the hold period.

little effect if the temperature was held at 60°F, it was decided to lower the

- during pay load recovery were reviewed. Since the item (nose cone) to be displayed will very from the unit recovered it is suggested that the importance of strict conservable of the photography, before release, again be stressed. This is particularly important in case of water recovery and release of still photography in Hessii.
- 7. Indications are that there will be numerous operational problems during and immediately after launch that could effect the success of each flight. Some of these are; selection of proper IMC settings, pay load conditions during long periods of hold, security; and, as in the case of the last shot, when should recovery be attempted, (had shot reached exhit) on the first, the second, or the third pass? Since those in the DCC Center are not immediately of the pay load or some of Headquarters requirements, some one from Headquarters should be present during each launch to resolve such problems. Early mesignment of Lt. Col. Hurphy to Pale Alto would solve this problem.
